## Pressure control valve

## Description

OLR is a rectangular pressure control valve for installation directly onto a wall. OLR consists of two sound-attenuating baffles, which are mounted either side of the wall and connected by means of the accompanying perforated wall sleeve, which ensures excellent noise reduction.

- High capacity
- Sound-attenuating baffles
- Can be installed in wall thicknesses from 90-170 mm

## Maintenance

Front plate can be removed to enable cleaning of internal parts. The visible parts of the diffuser can be wiped with a damp cloth.

## Dimensions

| Size | $\mathbf{A}$ <br> $\mathbf{m m}$ | $\mathbf{B}$ <br> $\mathbf{m m}$ | $\mathbf{L}$ <br> $\mathbf{m m}$ | $\mathbf{H}$ <br> $\mathbf{m m}$ |
| :---: | :---: | :---: | :---: | :---: |
| 400 | 400 | 130 | 300 | 50 |
| 600 | 600 | 130 | 500 | 50 |
| 800 | 800 | 130 | 700 | 50 |
| 1000 | 1000 | 130 | 900 | 50 |

Hole dimension $=\mathrm{L}+5 \mathrm{~mm} \times \mathrm{H}+5 \mathrm{~mm}$

## Materials and finish

Installation bracket: Galvanised stee
Front plate: Galvanised steel
Standard finish: Powder-coated
Standard colour: RAL 9010, Gloss 30
The diffuser is available in other colours. Please contact Lindab's sales department for further information.

## Sample calculation

When dimensioning an overflow diffuser, calculate the decrease in the wall's noise-reducing properties. For these calculations, the area of the wall and sound reduction figure $R$ must be known. This is adjusted in relation to the diffuser's $D_{n, e}$ value. $D_{n, e}$ is the diffuser's $R$ value given at a transmission area of $10 \mathrm{~m}^{2}$, as specified in ISO 140-10. The $D_{n, e}$ value can be converted into the $R$ value for other transmission areas using the table below.

| area $\left[\mathbf{m}^{2}\right.$ ] | 10 | 2 | 1 |
| :--- | :---: | :---: | :---: |
| correction [dB] | 0 | -7 | -10 |

The diagram below indicates the decrease in the wall's reduction figure, based on the diffuser, in a given octave band:

Area of wall $\left[\mathrm{m}^{2}\right]$ / Number of valves [-]

As a rough estimate the calculation can be performed directly using the wall's $R_{w}$ value.

Example:
$\begin{array}{ll}\mathrm{R}_{\mathrm{w}} \text { (wall) } & 50 \mathrm{~dB} \\ \mathrm{D}_{\mathrm{n}, \mathrm{e}, \mathrm{w}} \text { (diffuser) } & 44 \mathrm{~dB} \\ \text { Area of wall } & 20 \mathrm{~m}^{2}\end{array}$
Area of wall 20 m

$$
\begin{aligned}
& R_{w}-D_{n, e, w}=6 d B \\
& 20 \mathrm{~m}^{2} / 1=20 \mathrm{~m}^{2}
\end{aligned}
$$

Indicated reduction of $\mathrm{R}_{\mathrm{w}}$ (wall): 5
$R_{w}$ value for wall with diffuser $\sim 50-5=45 \mathrm{~dB}$
The calculation can also be performed using the following formula:

$$
\mathrm{R}_{\mathrm{res}}=10 \cdot \log \left(\frac{\mathrm{~S}}{\left(10 \mathrm{~m}^{2} \cdot 10^{\left.-0,1 \cdot \mathrm{D}_{\mathrm{n}, \mathrm{e}}\right)+\left(\mathrm{S} \cdot 10^{-0,1} \cdot \mathrm{R}_{\text {wall }}\right)}\right.}\right)
$$

where:

- $\mathrm{R}_{\mathrm{res}}$ is the resulting reduction figure for wall and diffuser.
- S is wall area.
- $D_{n, e}$ is the diffuser's $D_{n, e}$ value.
- $R_{\text {wall }}$ is the wall's $R$ value without diffuser.

## Technical data

## Capacity

Volume flow $\mathrm{q}_{\mathrm{v}}[/ / \mathrm{s}]$ and $\left[\mathrm{m}^{3} / \mathrm{h}\right]$, total pressure drop $\Delta \mathrm{p}_{\mathrm{t}}[\mathrm{Pa}]$ and sound effect level $L_{w A}[\mathrm{~dB}(\mathrm{~A})]$ are specified for a diffuser on either side of the wall.

Element-normalised reduction figure $D_{n, e}$
